

cable cop™

PATENT
PENDING

Stop this from happening to your door cable...

Have you ever had a cable jump or a cable unwind on your loading dock door? The dock area is filled with potential mishaps that can create problems with your door. Whether it's caused by a pallet or shrink wrap tube being left under the door or a leveler stored in the up position – unwinding cables on your dock door can be a major nuisance.

Cable Cop keeps the cable on the drum and automatically stops the door operator – *saving you costly downtime and a service call.*

Works with automatic door operators:

- Cable Cop instantly senses slack in the cable due to an obstruction in the door's path and then automatically reverses the door operator before the cable can unwind and bird nest.

...and with manual door operation:

- Cable Cop applies constant tension to the cable and takes up any excess slack that would normally cause a cable to jump.

...because bird nests
are for the birds.

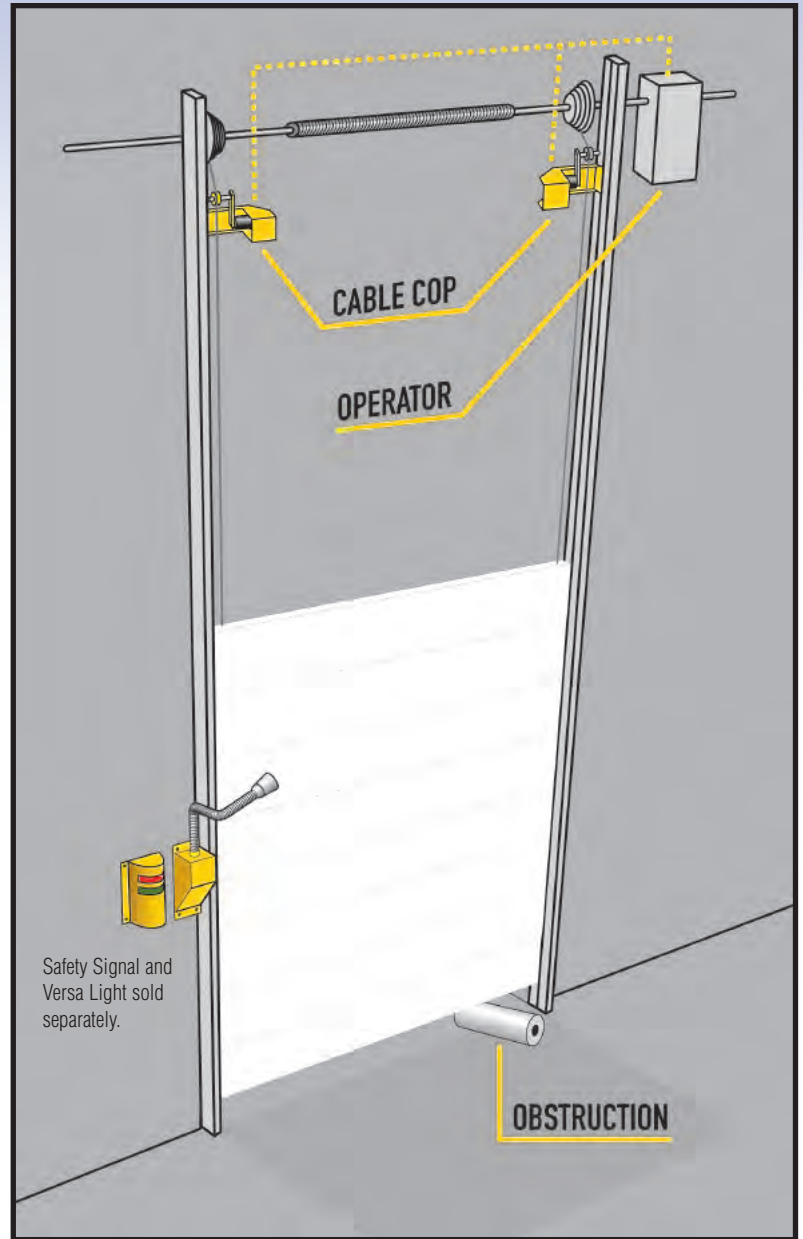

Cable pulley on a spring tension pivot arm keeps the door cable from coming off the cable drum

Pivot arm senses slack in the door cable when an obstruction is in the door's path and triggers the limit switch reversing the door's operation

Cable Cop works on Manual Doors and Doors with Automatic Operators

- Easy to install
- Resets automatically
- Mounts to existing mounting rails
- Keeps constant tension on door cable
- Pulley moves to track cable along drum
- Keeps cables in drum grooves when cable becomes slack due to obstruction in the door's path
- When Cable Cop Model CC200 is connected to the door's automatic operator it stops the door cable from unwinding by activating the limit switch, reversing the action of the door operator

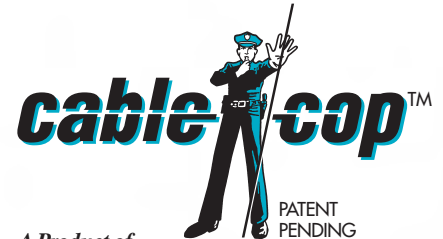

Model CC100 Specifications: For Manual Operated Doors

- Powder coated steel housing
- Spring loaded pivot arm
- Mounts to existing track with no modifications to cables or drums

Model CC200 Specifications: For Automatic Operated Doors

- Powder coated steel housing
- Spring loaded pivot arm
- Mounts to existing track with no modifications to cables or drums
- Limit switches wired into the automatic door opener reverse the door upon hitting an obstruction
